Provider ViaTalk (USA)

www.viatalk.com

Last Update: 10 October 2010

**dialplan/default.xml** (the snippet below is for 11 and 10 digit dialing)

```xml
<extension name="Long Distance">
    <condition field="destination_number" expression="^\d{10}$">
        <action application="bridge" data="sofia/gateway/viatalk/$1"/>
    </condition>
</extension>
```

**sip_profiles/external/viatalk.xml**

```xml
<include>
    <gateway name="Viatalk">
        <param name="username" value="1XXXXXXXX"/>
        <param name="password" value="XXXXXXXXX"/>
        <param name="proxy" value="chicago-la.vtnoc.net"/>
        <param name="register" value="true"/>
    </gateway>
</include>
```

By default ViaTalk uses DTMF inband. To get DTMF working with ViaTalk call customer support and have them switch your account to [RFC 2833](http://www.rfc-editor.org/info/rfc2833).

Do not include "realm" or "register-proxy."
