

# Provider internode OneSuite (USA & Canada)

OneSuite.com

 Last update: 7 January 2011

[onesuite.com](#) claims to support only their own softphone. But I just tested this with [onesuite.com](#) and it works.

Note that these files are set up for a multi-tenant FS server (i.e., multiple independent companies are hosted on one FS server).

This file goes under `$FS/conf/dialplan/public/onesuite.phonenumber.inbound.xml` (you could name the file anything ending in ".xml"):

```
<include>
  <extension name="in.2025551212">
    <condition field="destination_number" expression="^(UserName00713\-voip\.onesuite\.com)$">
      <action application="set" data="domain_name=my.dom.net"/>
      <action application="set" data="target_domain=my.dom.net"/>
      <action application="transfer" data="four_digit_extension_number XML my.dom.net"/>
    </condition>
  </extension>
</include>
```

And this file goes under `$FS/conf/sip_profiles/external/voip.onesuite.com.xml`:

```
<include>
  <gateway name="onesuite">
    <param name="username" value="UserName00713-voip.onesuite.com"/>
    <param name="fromuser" value="UserName00713-voip.onesuite.com"/>
    <param name="from-domain" value="voip.onesuite.com"/>
    <param name="fromdomain" value="voip.onesuite.com"/>
    <param name="password" value="some_digits"/>
    <param name="realm" value="voip.onesuite.com"/>
    <param name="proxy" value="voip.onesuite.com"/>
    <param name="expire-seconds" value="3600"/>
    <param name="register" value="true"/>
    <param name="retry-seconds" value="900"/>
    <param name="caller-id-in-from" value="true"/>
  </gateway>
</include>
```
